Treatment of bronchiolitis obliterans syndrome after lung transplantation with low dose interferon alfa-2b. There was a marked reduction in clinical score and histology consistent with bronchiolitis obliterans syndrome (BOS) following treatment with low dose Interferon (IFN). This suggests that low dose IFN may be a promising therapy for patients with BOS.

Q: How to compare if all methods in a class return a value of an object? If I have a class like this

```
public class myClass { public int firstMethod() { return 0; } public int secondMethod() { return 1; } public int thirdMethod() { return 2; } public int fourthMethod() { return 3; } }
```

How do I check if all methods return 0? Something like this

```
myClass x = new myClass(); if (x.allMethodsReturnedZero()) //do something
```

A: You can use the following extension method.

```
public static class Extension { public static bool AllMethodsReturnZero(this object input) { var result = input == null || !input.GetType().GetMethods().Any(x =>!x.ReturnType.IsVoid); return result; } }
```

A: There are two ways to solve this: you can create an extension method to solve your problem or you can create an IFormattable implementation which will also be used by .NET Framework types like Double, Decimal, TimeSpan, DateTime and other numeric types. Creating an extension method is very easy and it will work for your specific class (if you are using .NET Framework 3

What's New in the Photoshop Architectural Pattern Download?

We've all done it. You're sitting there gazing at your computer screen, minding your own business, when all of a sudden, bam!, the screen goes totally blank. If you're lucky, it's a blip, or something that has something to do with your hardware - perhaps a bad power supply, or one that's just overheating. But sometimes it's a major dud, a unit that just plain doesn't work. It's important to know how to take your computer apart, because it could save your favorite entertainment device, your productivity machine or even your life. That's why the following article was written: a quick tutorial on taking your machine apart, and what to check for when you do.

Your OS

When you remove the hard drive from your computer, you'll notice something on it. That's the hard drive partition. The "Os" can be anything, really, from Windows, to Linux, to a Mac. On the PC, that partition usually says "Windows 7/8" or "Vista" in the drive letter. Most people, when setting up a computer, will check that partition, simply to make sure that they can boot into it. When you're done, you'll want to check that partition with your OS of choice - usually that involves a LiveCD/DVD or ISO, which is an image file of your hard disk containing an operating system. Simply boot into that OS, which means that you'll be booted into your operating system, rather than Windows. Then, you'll want to identify the hard drive partition and test that it's read/writeable. This process can be more challenging if you've changed the hard drive. In that case, you'll need to boot into your operating system of choice, find the partition, and then identify that partition and make sure it's writeable.

Your CPU and Memory

CPU stands for "central processing unit." It's the piece of hardware that does all of the magic of math and logic in your computer. It's basically the brain of the computer. The motherboard has the CPU on it, and the data cables can be found under there, just to the left. RAM should be attached to the motherboard with a dual-row controller. It looks like this: Since you're checking RAM, be sure to use a dual-row RAM controller, and check that it's connected in a proper manner. If you remove it, it's
