[download] - [Mera Mujhse Hai Pehle Ka Nata Koi/Jya Re Tera Mujhse Hai Pehle Ka Naata Koi] suresh nair cover.. Tera Mujhse Hai Pehle Ka Naata Koi mp3Q: QTcpSocket setSocketOption clarification I'm using QTcpSocket. I have a server and client code, the client is able to send messages to the server with the working setSocketOption command, but it seems that I need a specific wait state to wait for a new message to come, then read it (or else I get an error before I receive the message. What I'm really trying to do is use this in a multi-threaded server to make sure that a specific thread continues where it left off with the last message, since it can read it and run for a while. Is this the correct way to do this? Do I need to do anything special to ensure that the socket option is set? Maybe I need to use recv() instead of read()? This is the command that sets the socket option: mSender.setSocketOption(QAbstractSocket::WaitForConnected, true); And this is the one that calls read() (if the socket option is set): mReciever.read(mBuffer, mBufferSize); A: The code above seems to be what you want, and it should work fine. waitForServerStateAndRead() is useful if you want to log information from the server until the user has explicitly said "stop" - but in your case it sounds like you're just expecting to get messages from the server. If your server has a known (previously configured) maximum message size, then you may want to increase that (I've seen systems that have a 4K limit or so). This way, when the server sends you a message that's larger than your desired max size, your function returns immediately and the socket automatically times out and waits for the socket to connect again. A: When you set a socket option you're supposed to receive any data available on the socket immediately: So if you want it to listen for incoming messages immediately, you should use the read() method and don't use the waiting mechanism: QTcpSocket
